

## **Zoom Boom Ticket Langley**

Zoom Boom Ticket Langley - Zoom Boom Training focuses on properly training potential operators on variable reach forklifts. The training objectives include gaining the understanding of the machine's physics and to be able to define the tasks of the operator. This course follows North American safety standards for lift trucks. Zoom boom training and certification is accessible at the company's location or at our site, provided there are a minimum number of trainees. Certification received upon successful completion is good for three years.

A telescopic handler (otherwise referred to as a telehandler) is similar in some ways to both a forklift and a crane. It is a versatile equipment designed with a telescopic boom that could extend forwards and lift upwards. Different attachments can be connected on the end of the boom, like bucket, pallet forks, muck grab or lift table. It is popular in agriculture and industry settings.

Telehandlers are most normally used with the fork attachment to be able to transport loads. The units have the advantage that they could get to places inaccessible to standard forklifts. Telehandlers could remove palletized loads from inside a trailer and placing them on places that are high like rooftops. For certain applications, they can be much more practical and efficient as opposed to a crane.

The disadvantage of the telehandler is its unsteadiness when lifting loads which are heavier. As the boom extends with a load, the unit becomes more and more unstable. Counterweights located at the back help, but do not solve the problem. As the working radius increases, the lifting capacity rapidly decreases. Some machines come with front outriggers that extend the lifting capacity when the machinery is stationary.
