

Boom Lifts

Boom lifts are machinery that has a platform that can be lowered or lifted to different heights, therefore making this piece of machinery an important necessity in a wide range of professions. Accessible in many different particular types such as aerial lifts, scissor lifts, and knuckle boom lifts, each type operates very specifically.

Aerial hoists are most commonly used to carry people at snowboard lodges who are not at ease using a snowboard lift. These platform lifts operate much like an elevator, skiers can be gradually moved up the mountain, stopping at stations along the path until they reach the top. Aerial hoists are also used in construction, moving personnel safely up and down the sides of multi-level construction sites.

Scissor lifts are also in the boom jack class. They are utilized normally by utility companies as an ideal system to permit staff to finish upkeep and repair on wires and cables that are attached to poles. Telephone, cable and power companies have relied on the proficiency of this kind of boom lift for years.

Knuckle boom forklifts are built to be utilized in rough terrain locales where the need to be able to change course is necessary. This type of boom can fit into many tight places that a scissor lift cannot. Working amid numerous equipment in a manufacturing plant or in close proximity between two walls, the knuckle boom also features a standard table equipped with rails for protection and employee safety.

The kind of boom jack needed by companies will usually depend on the nature of the job needed. Luckily, there are suitable versions for practically any task.
